

## Robust Hall effect encoders with flange mount

## Family HTx25

HTx25 PG

HTx25 M8

HTx25 PGR

HTx25 M8R

### Key features

- Ø25 mm aluminium metal housing
- Maximum life time expectation
- High continuous actuation shaft speeds
- Magnetic, gradient-based signal evaluation
- Digital signal processing
- Double ball bearings
- Ø4 or Ø6 mm stainless steel shaft
- Shaft bearings IP65, housing IP68
- Operating temperature range -30..85°C
- Measurement range up to 360° singleturn, 72000° multturn
- Electrical connections M8 plug or round cable
- Programmable signal output function (factory or field-programmable/teach-in)
- Cable/connector M8 plug or cable, outlet radial or axial

### Applications

- Plant engineering
- Mechanical engineering
- Equipment manufacturing
- Driverless transport systems
- Medical equipment
- Special vehicles
- Industrial robots
- Motor control units
- Stage technology

### Output variants

			Incremental (HTx25)	Multiturn HTx25PM	Drawings	Technical Data	Accessories
			Redundant Serial (HTx25)	SER/SPI/SSI Redundant	PWM (HTx25PM)	Voltage/Current Analogue (HTx25)	
Singleturn absolute encoders			▪ Analogue voltage or current loop output (12 bit resolution)				
			▪ PWM output (12 bit resolution)				
			▪ Digital outputs SPI (14 bit, also redundant), SSI (10 to 18 bit resolution)				
			▪ Absolute linearity up to 0.6%				
Programmable Multi- or singleturn absolute encoders			▪ Analogue voltage or current loop output (12 bit resolution)				
			▪ Not True-Power-On, max. 200 revolutions (72000°)				
			▪ With Teach-In Function				
Incremental encoders			▪ 1 to 1024 Impulses per revolution (ppr.)				
			▪ Outputs TTL, Push-Pull (HTL), Open Collector				

## HTx25 encoders – robust and compact

The encoders of the HTx25 series are specially designed for use in demanding environments where space is limited. Housed in a Ø25 mm metal body, these contactless encoders offer a wide range of electronic and mechanical options. Whether as incremental or absolute value encoders, they cover a wide range of applications and, depending on the output electronics, are used in machines, plants, laboratory equipment and medical devices, for example.

The HTx25 is the smallest metal encoder in the MEGATRON product range. It has a solid aluminium housing, a high IP protection and a stainless steel shaft supported by two ball-bearings, which allows for high operating speeds. Signal processing is digital and based on the latest Hall sensor technology, which ensures reliable magnetic recording of the measured values. The gradient-based evaluation ensures high immunity to temperature variations and EMC influences. The encoders are designed for maximum durability, even outperforming optical encoders. The number of defects or failures in rotary encoders with this technological design is virtually zero, even after decades of use.

In addition to a wide range of standard options, the modular design of the HTx25 encoders allows them to be tailored to the specific requirements of the application. The concept also allows for timely customisation (even in small batches) based on a clearly structured pricing model. Typical modifications include customer-specific shaft geometries, customised signal output functions, special cable lengths or customised electrical connection cables.

Pin-Numbering of socket connector in the encoder housing

The orientation of the connector relative to the encoder body is not defined and varies from encoder to encoder. When using right-angle connectors in combination with axial outlets, the orientation of the cable outlet is therefore not defined.

If you need a defined orientation of the cable outlet, please choose our housings with radial cable outlet and use straight mating connectors.

Orientation will vary when using angled connectors.

For details on zero point definition and output programming see page 31.

### Order example HTA25

#### Requirements:

Shaft Ø 6.00 mm, shaft length 12 mm, VSUP=5 V / OUT=0 to 5 V, sense of rotation CW, rotation angle 360° round cable 1.00 m

#### Example for order code:

HTA25 6x12 0505 CW360 PG

## Absolute Encoders with Redundant Voltage Output

## Series HTA25X

### Series HTA25X – singleturn, analogue output, redundant

#### Key features HTA25X :

- Independent signal processing. The HTA25X rotary encoder electronics are based mainly on one Hall IC in which two semiconductor dies independently capture, evaluate and output the measured values
- Supply voltage, signal output and ground are galvanically insulated => separate electrical connections
- Supply voltages: 2 x 5 VDC or 2 x 15 to 30 VDC
- Signal outputs: 2 x 0 to 5 V or 2 x 0 to 10 V

### Electrical data HTA25X – singleturn, analogue output, redundant

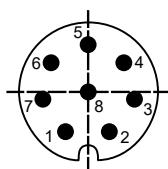

Effective electrical angle of rotation 1.)	$7^\circ \leq \alpha \leq 360^\circ$ (programmable at factory), $\pm 0.5^\circ$	
Independent linearity (best straight line) 1.)	$\pm 0.3\%$ @ $360^\circ$	
Absolute Linearity 1.)	$\pm 0.6\%$ @ $360^\circ$	
Output signal	0 to 5 V ratiometric	0 to 10 V
Resolution	12 Bit	
Update rate	200 $\mu$ s	
Supply voltage	5 V $\pm 10\%$	15 to 30 V
Power consumption (no load)	$\leq 23$ mA	
Output load	$\geq 5$ kOhm	
Insulation voltage 1.)	1000 VAC @ 50 Hz, 1 min	
Insulation resistance 1.)	2 MOhm @ 500 VDC, 1 min	
MTTF (EN29500-2005-1)	613a	202a

1.) According IEC 60393

### Cable and pin assignment HTA25X – singleturn, analogue output, redundant

### Order example HTA25X – redundant, singleturn, analogue output

#### Requirement:

Redundant, shaft Ø 6.00 mm, shaft length 12 mm, VSUP=5 V /OUT=0...5 V, signal 1 sense of rotation CW, signal 2 sense of rotation CW, electrical rotation 360° signal 1 and 2, M8 plug radial, 8 pin

#### Example for order code:

HTA25X 6x12 0505 CW CW 360 M8R

## Series HTP25 – singleturn, PWM output, not redundant

## Key features HTP25:

- PWM signal output
- Frequency 244 Hz (constant)
- Pulse width (duty cycle) 10% (0°) to 90% (360°)
- Supply voltage: 5 VDC +/-10%

## Electrical data HTP25 – singleturn, PWM output, not redundant

Effective electrical angle of rotation 1.)	$7^\circ \leq \alpha \leq 360^\circ$ (programmable in factory), $\pm 0.5^\circ$
Independent linearity (best straight line) 1.)	$\pm 0.4\%$ @ $360^\circ$
Absolute Linearity 1.)	$\pm 0.6\%$ @ $360^\circ$
Output signal	PWM (pulse width modulation)
Output signal voltage	5 V
Carrier frequency	244 Hz (constant)
Minimum duty cycle	10%, equal to app. 0.4 ms
Maximum duty cycle	90%, equal to app. 3.5 ms
Resolution	12 Bit
Supply voltage	5 V $\pm 10\%$
Power consumption (no load)	$\leq 10$ mA
Output load	$\geq 5$ kOhm
Insulation voltage 1.)	1000 VAC @ 50 Hz, 1 min
Insulation resistance 1.)	2 MOhm @ 500 VDC, 1 min
MTTF (EN29500-2005-1)	1267a

1.) According IEC 60393

## Function description PWM signal output HTP25

The HTP25 provides a constant carrier frequency with 244 Hz at the signal output, with HIGH and LOW signal levels which have a constant signal amplitude. A constant carrier frequency means a constant length of the period duration. The duty cycle and thus the pulse width changes in dependency of the rotating angle between 10% to 90% relative to the signal period. If the CW option is selected, the duty cycle increases clockwise when turning the shaft clockwise. If the CCW option is selected, the duty cycle decreases clockwise if the shaft is turned clockwise. Normally no signal conversion is required for further processing of the output signal, because many µControllers already have an input for PWM signals.

## Absolute Encoders with Pulse Width Modulation (PWM)

### Order example HTP25 – singleturn, PWM output, not redundant

#### Requirement:

Shaft Ø 6.36 mm, shaft length 12 mm, VSUP=5 V / OUT=244 Hz, sense of rotation CW, rotation angle 360°, M8 connector

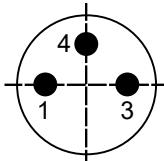

#### Example for order code:

HTP25 6,35x12 5PWM CW 360 M8

### Cable and pin assignment

Function	Option PG(R)	Option M8(R)
OUT	brown	Pin 3
VSUP	red	Pin 1
GND	black	Pin 4

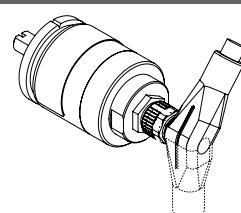

### Plug M8 (R) – pin assignment for 3-pin connector

Pin-Numbering of socket connector in the encoder housing

The orientation of the connector relative to the encoder body is not defined and varies from encoder to encoder. When using right-angle connectors in combination with axial outlets, the orientation of the cable outlet is therefore not defined.

If you need a defined orientation of the cable outlet, please choose our housings with radial cable outlet and use straight mating connectors.

Orientation will vary when using angled connectors.

For details on zero point definition and output programming see page 31.

### Series HTS25 – singleturn, digital output, not redundant

#### Key features HTS25:

- SPI interface with 14 bit resolution and 5 V input voltage  
Attention: Signal transmission only possible via short signal lines
- SSI interface with 10-18 bit resolution and wide input range (4.8 to 42 V)

### Electrical data HTS25 – singleturn, digital output, not redundant

Output signal	SPI	SSI
Effective electrical angle of rotation 1.)		360°
Independent linearity (best straight line) 1.)	±0,3% @ 360°	please contact us
Absolute linearity 1.)	±0,6% @ 360°	please contact us
Resolution	14 Bit	10-18 Bit
Update rate	200 µs	18 µs
Supply voltage	5 VDC ±10 %	4.8 to 42 V
Power consumption (no load)	≤ 12 mA	≤ 24 mA (for 5 V input)
Insulation voltage 1.)		1000 VAC @ 50 Hz, 1 min
Insulation resistance 1.)		2 MOhm @ 500 VDC, 1 min

Pin-Numbering of socket connector in the encoder housing

The orientation of the connector relative to the encoder body is not defined and varies from encoder to encoder. When using right-angle connectors in combination with axial outlets, the orientation of the cable outlet is therefore not defined.

If you need a defined orientation of the cable outlet, please choose our housings with radial cable outlet and use straight mating connectors.

Orientation will vary when using angled connectors.

### Synchronous Serial Interface (SSI) - A simple yet robust interface

The synchronous serial interface (SSI) is a serial interface, i.e. the individual bits are transmitted in chronological order. The basis of data transmission is a shift register in which the encoder provides its current measured value. The rotary encoders function as so-called SSI slaves, because they only supply the values from the shift register at the DO (data out) output on receipt of a clock sequence sent out by the SSI master, the so-called "clock" signal (CLK). This clock signal is applied to the CLK input of the encoder. Both the clock signal and the data signal are transmitted differentially, which makes this type of data interface particularly robust against interference. In short, SSI enables the memory of a sensor to be read out reliably from an external source.

#### Data transmission

The SSI electronics of the encoder reacts to the first falling edge that arrives via the CLK line of the master, loads the current data into the register and transmits it bit by bit to the receiver with each rising edge of the clock. The composition of the transmitted information is not standardised and varies from manufacturer to manufacturer, sometimes even from product to product.

In MEGATRON's encoders, the position information is transmitted first (starting with the Most Significant Bit MSB, ending with the Least Significant Bit LSB). The maximum value of this information is limited by the number of bits transmitted. This is also the resolution of the measurement data. For example, a resolution of 10 bits corresponds to a number of  $2^{10} = 1024$  steps, which are divided over the angular range of  $360^\circ$ . Thus, after receiving the position information, it is easy to calculate back to the absolute angle, because each single step would correspond to  $360/1024 = 0.35^\circ$ .

The position information is followed by a bit sequence of status data that can be of great interest for the application. This includes, for example, the status of the electronics (readiness, correct supply voltage), but also whether the magnetic field acting on the Hall sensor is within the permissible limits (i.e. the distance of the magnet from the sensor). The last bit is the parity bit. This takes the values HIGH or LOW as required, so that the encoder always sends an even number of bits (even parity). The receiver, i.e. the SSI master, must be set to the total length of the transmitted information including the parity bit.

At the end of the process, the master usually does not send any further edges to the encoder via the CLK line. The encoder then waits for a time  $t_m$ , (retriggerable monoflop) since the last CLK edge and then updates the data in the shift register. This is therefore the minimum pause time between two consecutive clock sequences when the master requires new, updated measurement data. The exact protocol description of the HTS encoders follows on the next page

#### Ring shift

However, if clock edges continue to be sent, then the encoder will start transmitting the same data set repeatedly after a zero bit. This procedure is also called ringshift. This makes sense, for example, if the parity bit would be incorrect from the master's point of view, if the data is otherwise corrupt and a new transmission is therefore requested, or if a higher transmission reliability is generally desired by comparing multiple transmissions of the same data. With ring shift, the transmission is also terminated and the latest measurement data is only loaded into the register again when no more clock signals arrive at the encoder for a minimum time  $t_m$ .

#### Early stop

The transmission of the data can be interrupted by the master at any time, e.g. also after the 10th bit. Even then, the internal timer (monoflop) expires, causing the data in the register to be reloaded after the time  $t_m$ . In this way, for example, only a part of the encoder data can be read out (e.g. 10 of the available 16 bits, no status data at all) and a higher update rate can be achieved, as the remaining information is simply omitted.

#### Notes on cable length

The higher the transmission rate (clock rate), the smaller the realisable cable length with SSI. These are physical limits that are not limited by the sensor product itself. A simple blanket statement about the actual realisable length is not easily possible.

The cable length that can actually be realised in the application is influenced by the following factors:

- Quality and design of the cable (shielding, conductor cross-section, conductor resistance, twisted cores, etc.).
- Ambient conditions (sources of interference such as motors, etc.)

We explicitly refer to the RS-422 standard regarding cable lengths.

### Protocol description – Synchronous Serial Interface (SSI)

The HTS25K SSI encoder provides a 10-bit to 18-bit absolute position output, while 16 bit is the standard (ex works) configuration. This means that the full rotation angle ( $360^\circ$ ) is divided into steps of the respective resolution (16 bits yields 65.536 steps of approx. 0.005 degrees).

Standard configuration (16 bit output) yields the following pulse train, consisting both of position and status data:

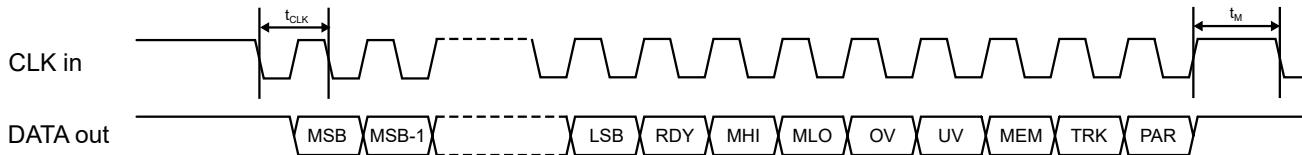

23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
16 bits position data												7 bits status data											

The data structure for any resolution is as follows:

Position data (10 to 18 bits)				Status (7-bit)							Parity 1 bit
MSB	MSB-1	...	LSB	RDY	MHI	MLO	OV	UV	MEM	TRK	PAR

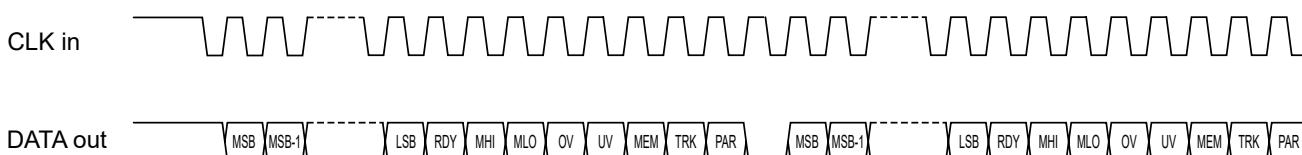

Abbreviation	Description
MSB to LSB	n-bits position data, selectable from 10 to 18 bits ex works, standard is 16 bit
RDY	The encoder is ready (if value is HIGH).
MHI	This indicates that the magnet strength detected by the Hall chip is too strong. If this is consistently HIGH, change to a weaker magnet or increase the distance between the encoder and the magnet. The value for this alarm is displayed as 1.
MLO	This indicates that the magnet strength detected by the Hall chip is too weak. If this is consistently HIGH, change to a stronger magnet or decrease the distance between the encoder and the magnet. The value for this alarm is displayed as 1.
OV	Oversupply voltage error at Hall Chip if HIGH. Might indicate defective voltage regulator (encoder's internal regulator).
UV	Undervoltage error if HIGH. Might indicate too low input voltage or defective voltage regulator (encoder's internal regulator).
MEM	If HIGH, a memory corruption has occurred. Perform a power cycle to reload the memory.
TRK	This indicates that the angular error has exceeded $5^\circ$ within 5 ms. When this value stays at HIGH, perform a power-cycle to re-initialize the sensor.
PAR	Parity is even

Data is transmitted according to the following timing diagram:

Symbol	Description	Min.	Typ.	Max.
$t_{CLK}$	Serial clock period	4 $\mu$ s		$t_{M/2}$
$t_M$	monoflop, time between two successive SSI reads	16.5 $\mu$ s	18 $\mu$ s	

Data is latched on the first CLK falling edge and is transmitted on the next falling edge. Both signals are transmitted differentially and therefore have 2 connections (+/-) each. Data will be refreshed when the next monoflop ( $t_M$ ) expires. If another clock train is sent before this time expires, the same position data is output, and the data is separated by a single low bit:

## Protocol description – Serial Peripheral Interface (SPI)

### Introduction

The encoder is configured as a Slave node. The serial protocol of the is a three wires protocol (/SS, SCLK, MOSI-MISO):

- /SS output is a 5 V tolerant digital input
- SCLK output is a 5 V tolerant digital input
- MOSI-MISO output is a 5 V tolerant open drain digital input/output

Basic knowledge of the standard SPI specification is required for the good understanding of the present section.

Even clock changes are used to sample the data. The positive going edge shifts a bit to the Slave's output stage and the negative going edge samples the bit at the Master's input stage.

### MOSI (Master Out Slave In)

The Master sends a command to the Slave to get the angle information.

### MISO (Master In Slave Out)

The MISO of the slave is an open-collector stage. Due to the capacitive load, a  $>1\text{ k}\Omega$  pull-up is used for the recessive high level (in fast mode). Note that MOSI and MISO use the same physical wire of the ETS25.

### /SS (Slave Select)

The /SS output enables a frame transfer. It allows a re-synchronization between Slave and Master in case of a communication error.

### Master Start-Up

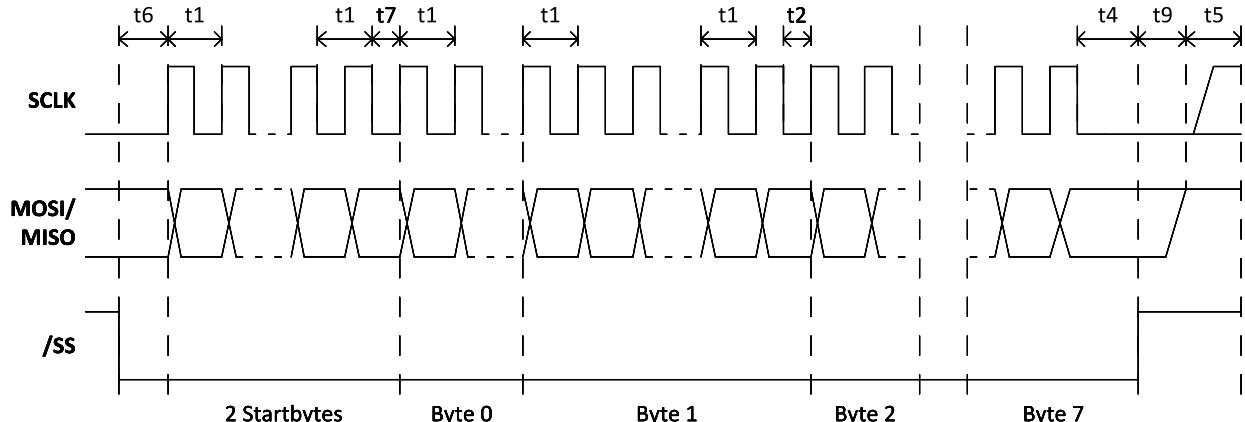

/SS, SCLK, MISO can be undefined during the Master start-up as long as the Slave is re-synchronized before the first frame transfer.

### Slave Start-Up

The slave start-up (after power-up or an internal failure) takes 16 ms. Within this time /SS and SCLK is ignored by the Slave. The first frame can therefore be sent after 16 ms. MISO is Hi-Z (i.e. Hi-Impedance) until the Slave is selected by its /SS input. The encoder will cope with any signal from the Master while starting up.

### Timing

To synchronize communication, the Master deactivates /SS high for at least t5 (1.5 ms). In this case, the Slave will be ready to receive a new frame. The Master can re-synchronize at any time, even in the middle of a byte transfer. Note: Any time shorter than t5 leads to an undefined frame state, because the Slave may or may not have seen /SS inactive.

**Protocol description – Serial Peripheral Interface (SPI) (continuation)**
**Description Timings**

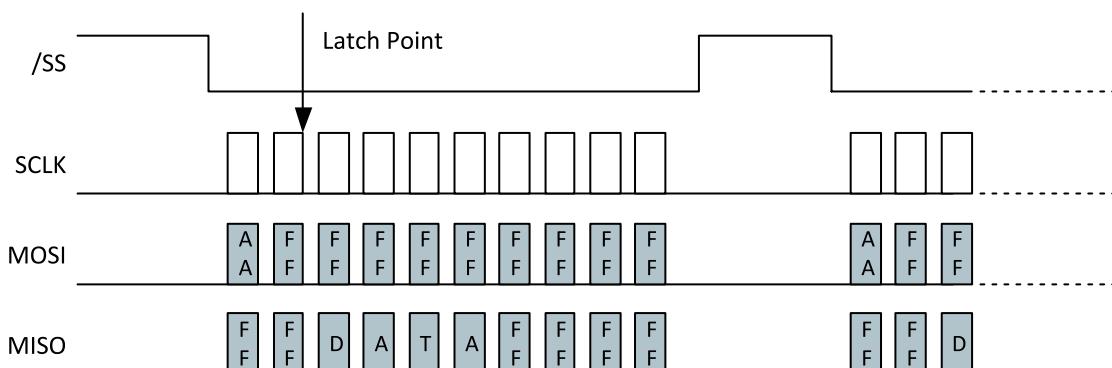

Timings	Min	Max	Remarks
t1	2.3 µs	-	No capacitive load on MISO. t1 is the minimum clock period for any bits within a byte.
t2	12.5 µs	-	t2 the minimum time between any other byte
t4	2.3 µs	-	Time between last clock and /SS=high=chip de-selection
t5	300 µs	-	Minimum /SS = Hi time where it's guaranteed that a frame re-synchronizations will be started
t5	0 µs	-	Maximum /SS = Hi time where it's guaranteed that NO frame re-synchronizations will be started.
t6	2.3 µs	-	The time t6 defines the minimum time between /SS = Lo and the first clock edge
t7	15 µs	-	t7 is the minimum time between the StartByte and the Byte0
t9	-	< 1 µs	Maximum time between /SS = Hi and MISO Bus HighImpedance
T <sub>Startup</sub>	-	< 10 ms	Minimum time between reset-inactive and any master signal change

**Slave Reset**

On internal soft failures the Slave resets after 1 second or after an (error) frame is sent. On internal hard failures the Slave resets itself. In that case, the Serial Protocol will not come up. The serial protocol link is enabled only after the completion of the first synchronization (the Master deactivates /SS for at least t5).

**Frame Layer**
**Command Device Mechanism**

Before each transmission of a data frame, the Master should send a byte AAh to enable a frame transfer. The latch point for the angle measurement is at the last clock before the first data frame byte.

**Data Frame Structure**

A data frame consists of 10 bytes:

- 2 start bytes (AAh followed by FFh)
- 2 data bytes (DATA16 – most significant byte first)
- 2 inverted data bytes (/DATA16 - most significant byte first)
- 4 all-Hi bytes

The Master should send AAh (55h in case of inverting transistor) followed by 9 bytes FFh. The Slave will answer with two bytes FFh followed by 4 data bytes and 4 bytes FFh.

## Protocol description – Serial Peripheral Interface (SPI) (Fortsetzung)

### Timing

There are no timing limits for frames: a frame transmission could be initiated at any time. There is no interframe time defined.

### Data Structure

The DATA16 could be a valid angle or an error condition. The two meanings are distinguished by the LSB.

#### DATA16: Angle A[13:0] with (Angle Span)/2<sup>14</sup>

Most Significant Byte														Least Significant Byte	
MSB							LSB	MSB						LSB	
A13	A12	A11	A10	A9	A8	A7	A6	A5	A4	A3	A2	A1	A0	0	1

#### DATA16: Error

Most Significant Byte														Least Significant Byte	
MSB							LSB	MSB						LSB	
E15	E14	E13	E12	E11	E10	E9	E8	E7	E6	E5	E4	E3	E2	E1	E0

#### DATA16: Error

BIT	Name	Description
E0	0	
E1	1	
E2	F_ADCMONITOR	ADC Failure
E3	F_ADCSATURA	ADC Saturation (Electrical failure or field too strong)
E4	F_RGTOOLOW	Analog Gain Below Trimmed Threshold (Likely reason: field too weak)
E5	F_MAGTOOLOW	Magnetic Field Too Weak
E6	F_MAGTOOHIGH	Magnetic Field Too Strong
E7	F_RGTOOHIGH	Analog Gain Above Trimmed Threshold (Likely reason: field too strong)
E8	F_FGCLAMP	Never occurring in serial protocol
E9	F_ROCLAMP	Analog Chain Rough Offset Compensation: Clipping
E10	F_MT7V	Device Supply VDD Greater than 7V
E11	-	
E12	-	
E13	-	
E14	F_DACMONITOR	Never occurring in serial protocol
E15	-	

### Angle Calculation

All communication timing is independent (asynchronous) of the angle data processing. The angle is calculated continuously by the Slave every 350 µs at most. The last angle calculated is hold to be read by the Master at any time. Only valid angles are transferred by the Slave, because any internal failure of the Slave will lead to a soft reset.

### Error Handling

In case of any errors listed above, the Serial protocol will be initialized and the error condition can be read by the master. The slave will perform a soft reset once the error frame is sent. In case of any other errors (ROM CRC error, EEPROM CRC error, RAM check error, intelligent watchdog error...) the Slave's serial protocol is not initialized. The MOSI/MISO output will stay Hi-impedant (no error frames are sent).

### Series HTS25X – singleturn, SPI output, redundant

#### Key features HTS25X:

- Independent signal processing. The HTS25X rotary encoder electronics are based on one Hall IC in which two semiconductor elements independently capture, evaluate and output measured values
- Supply voltage, signal output and ground are galvanically insulated => separate electrical connections
- Supply voltage: 2 x 5 VDC ±10%
- Signal output: 2 x SPI

### Electrical data HTS25X – singleturn, SPI output, redundant

Effective electrical angle of rotation 1.)	360°
Sense of rotation (when looking at the shaft, from the front)	Clockwise/clockwise (ganging)
Independent linearity (best straight line) 1.)	±0.4% @ 360°
Absolute linearity 1.)	±0.8% @ 360°
Output signal	SPI
Resolution	14 Bit
Update rate	200 µs
Supply voltage	5 VDC ±10%
Power consumption (no load)	≤ 24 mA
Insulation voltage 1.)	1000 VAC @ 50 Hz, 1 min
Insulation resistance 1.)	2 MOhm @ 500 VDC, 1 min
MTTF (EN29500-2005-1)	2046a

1.) According IEC 60393

### Cable and pin assignment HTS25X

Function:	Option PG(R), round signal cable	Option M8(R), 12 pin
VDD 1	red	1
GND 1	black	2
MOSI 1	yellow	3
SCLK 1	green	4
SS 1	orange	5
VDD 2	white	6
GND 2	blue	7
MOSI 2	violet	8
SCLK 2	brown	9
SS 2	grey	10
-	-	11 n/c
-	-	12 n/c

For details on zero point definition and output programming see page 31.

## Absolute Encoders with Serial Redundant Output (SPI)

## Series HTS25X

Order Code HTS25X – redundant, singleturn, digital output				
Description	Selection: standard=black/bold, possible options=grey/italic			
Series	HTS25X			
<b>Shaft diameter, shaft length:</b> Shaft diameter Ø 6 mm, shaft length 12 mm Shaft diameter Ø 4 mm, shaft length 10 mm Custom shaft dimensions [mm] Ø ≤ 6.35 mm		6x12 4x10 Xxxx		
<b>Supply voltage / output signal:</b> 5 VDC ± 10% / SPI (14 Bit), redundant			05SPI	
<b>Electrical connection, cable length:</b> 1 m round cable, axial 1 m round cable, radial Plug M8, axial Connector M8, radial Round cable, customer-specific cable length [X.XX m], axial Round cable, customer-specific cable length [X.XX m], radial				PG PGR M8 M8R PGX,XX PGRX,XX

### Order example HTS25X

#### Specifications:

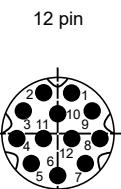

Shaft Ø 6.00 mm, shaft length 12 mm, 14 Bit/5 VDC/SPI, M8 connector, radial

#### Example for order code:

HTS25X 6x12 05SPI M8R

Please be aware of limiting factors in the cable lengths / transmission limits of serial communication.  
Baud rate/clock frequency must be adjusted to avoid transmission problems.

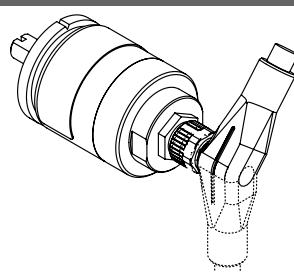

### Plug M8 – pin assignment for 12-pin connector

Pin-Numbering of socket connector in the encoder housing

The orientation of the connector relative to the encoder body is not defined and varies from encoder to encoder. When using right-angle connectors in combination with axial outlets, the orientation of the cable outlet is therefore not defined.

If you need a defined orientation of the cable outlet, please choose our housings with radial cable outlet and use straight mating connectors.

Orientation will vary when using angled connectors.

## Series HTI25 – singleturn, incremental output, not redundant

**Key features HTI25:**

- Channels: A, B and index signal Z
- TTL or Open Collector electronics
- Maximum number of pulses per channel 20.000 pulses per revolution
- Option: ex works programmable number of pulses in pulse step width 1

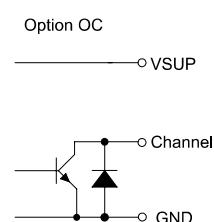

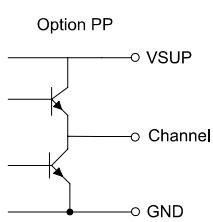

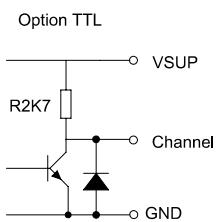

## Electrical data HTI25K – singleturn, incremental output, not redundant

Output Signal	TTL	Open Collector	
Number of pulses	1 to 1024 ppr	1 to 20.000 ppr	
Limit frequency	100 kHz	250 kHz	
Switch-on delay	20 ms	6.3 ms	
Supply voltage	3.3 or 5 VDC ±10%	4.8 to 42 V	
Power consumption (no load)	≤ 15 mA	≤ 24 mA (for 5 V input)	
Output load	≥ 5 kOhm		
Max. pull-up voltage	-	42 VDC	
Max. pull-up current		600 mA	
Insulation voltage 1.)	1000 VAC @ 50 Hz, 1 min		
Insulation resistance 1.)	2 MOhm @ 500 VDC, 1 min		
MTTF (SN29500-2005-1)	473a	1000a	

1.) According to IEC 60393

## Output circuit HTI25 per channel

For details on zero point definition and output programming see page 31.

## Incremental Encoders

## Series HTI25

Pin 7	n/c		
Pin 8	<b>n/c</b>		

### Plug M8 – pin assignment for 8-pin connector

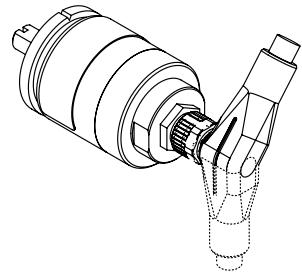

Pin-Numbering of socket connector in the encoder housing

8 pin (HTI25)

The orientation of the connector relative to the encoder body is not defined and varies from encoder to encoder. When using right-angle connectors in combination with axial outlets, the orientation of the cable outlet is therefore not defined.

If you need a defined orientation of the cable outlet, please choose our housings with radial cable outlet and use straight mating connectors.

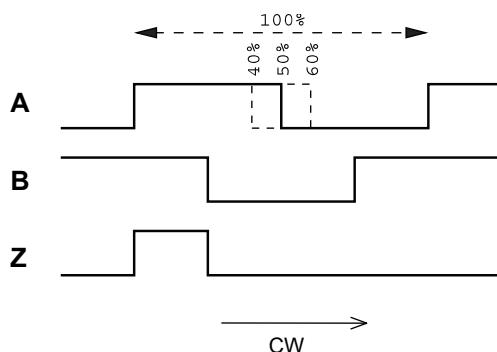

Orientation will vary when using angled connectors.

### Signal details

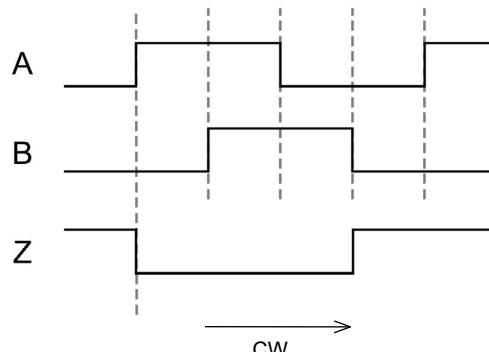

Incremental signal output function

A, B, Z (version 05BZTTL)

The percentage information describes the proportion of a pulse in dependency to the duration of one period

A, B, Z (version BZOC)

## Series HTA25PM – multi-/singletturn, programmable, analogue output, not redundant

## Key features HTA25PM :

- Measuring range 10° to max. 72000° (200 shaft revolutions)
- Programmable by the user. Programmable are the sense of rotation (CW/CCW) and the effective electrical angle [°]
- Programmable up to 10000 times
- Can also be used as a programmable singletturn rotary encoder
- Maximum rotation of the shaft in a voltage-free state without loss of the angle information +/-179°
- Factory programming (ex works): effective electrical angle of rotation 3600° (10 shaft revolutions), sense rotation CW

## Electrical data HTA25PM – multi-/singletturn, programmable, analogue output, not redundant

	0 to 10° - 0 to 72000° (max. 200 turns) Start point, endpoint and sense of rotation programmable by the customer. Ex works the angle is set to 3600°. For detecting absolute position >360° the sensor should not be turned more than ±179° without supply voltage.		
Effective electrical angle of rotation 1.)	0 to 5 V	0 to 10 V	4 to 20 mA
Independent linearity (best straight line) 1.)		±0.05% @ 3600°	
Absolute Linearity 1.)		±0.1% @ 3600°	
Output signal	0 to 5 V	0 to 10 V	4 to 20 mA
Resolution 1.)		12 Bit	
Update rate		3 ms	
Supply voltage	9 to 30 V	15 to 30 V	11 to 30 V
Power consumption (no load)		< 10 mA	< 14 mA
Output load		≥ 5 kOhm	≤ 500 Ohm
Insulation voltage 1.)		1000 VAC @ 50 Hz, 1 min	
Insulation resistance 1.)		2 MOhm @ 500 VDC, 1 min	
Max. number of programming cycles		10000	
MTTF (EN29500-2005-1)		224a	229a

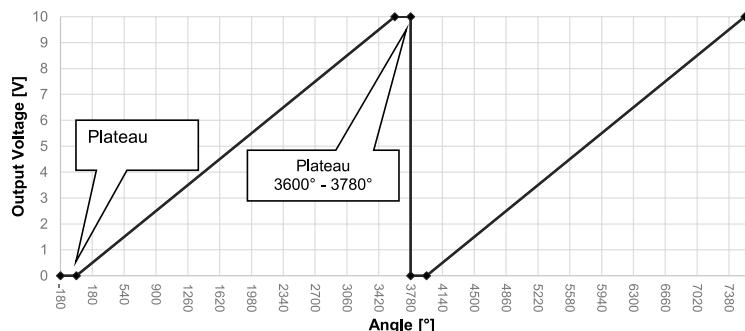

1.) According IEC 60393

## Signal output function (factory programming). Automatic function for inserting signal plateaus

The function represents the relationship between the zero degree marking on the rotary encoder housing in dependency to the 0° position of the shaft and the resulting output signal in the state of delivery, when turning the shaft clockwise (sense of rotation CW). The effective electrical angle of rotation is 3600° ex works. Before and after the linearly rising output signal for 3600° the HTA25PM integrates automatically signal plateaus for a rotation angle of each 180° .

The following example shows the output signal pattern when actuating the shaft in the delivery state for 11 revolutions clockwise (sense of rotation CW), starting at the 0° position:

1. 10 rotations of the shaft clockwise 0° to 3600°, linearly increasing output signal 0% to 100% FS
2. 1/2 rotation of the shaft 180° (3600° to 3780°) signal plateau 100% FS
3. 1/2 rotation of the shaft 180° (3780° to 3960°) signal plateau 0% FS

The drawing shows the signal-amplitude function for 0 to 10 V signal output

## Programmable Multi-/Singleturn Encoders

HTA25PM

### Definition of the zero position / anti-rotation pin

#### Output at the zero point:

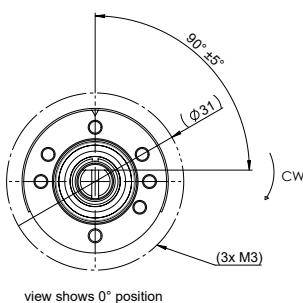

HTA25 (analogue outputs): Output signal 0% full scale (F. S.)

HTP25 (PWM output): duty cycle 10% (10% duty cycle)

HTS25 (serial output): Output signal 0% full scale (F. S.)

HTI25 (incremental output): The index signal is output (Z)

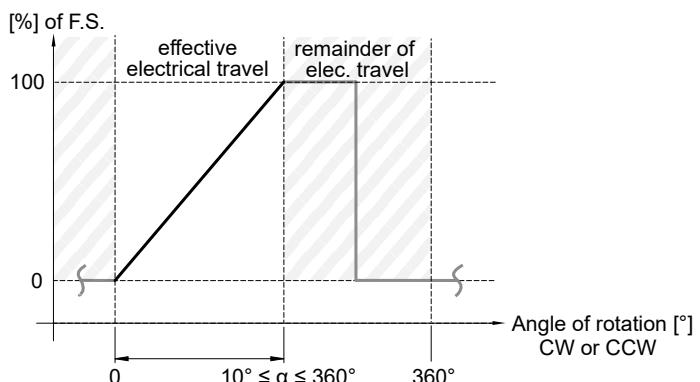

Position of the zero position see drawing below (nudge at top)

### Signal definition for custom rotation angles

Custom angles <360°

When programming the electrical angle of rotation of <360°, the remaining non-effective range of rotation is divided equally into high and low.

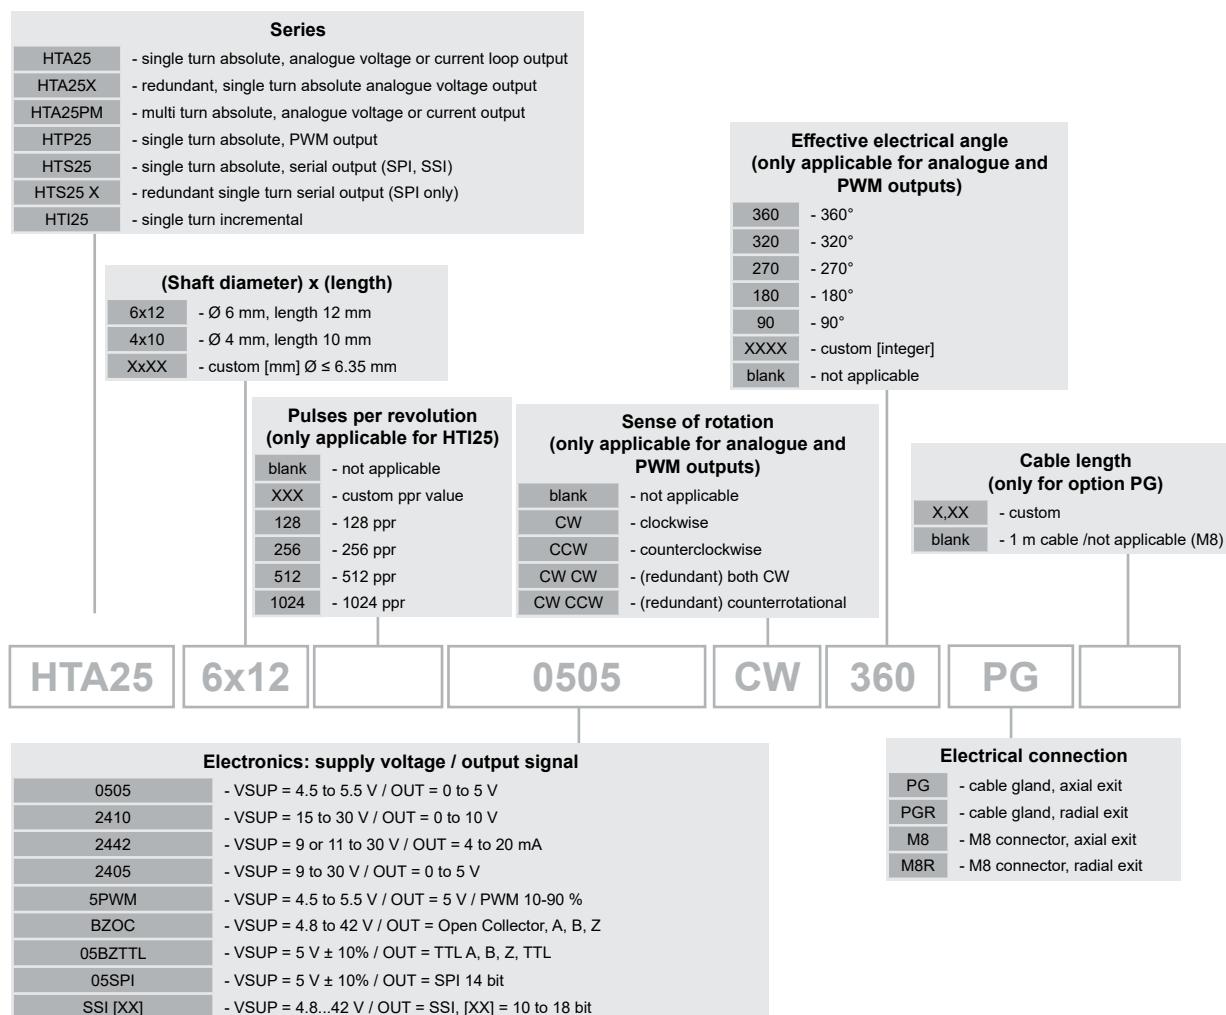

## Order Codes - Full Overview

## Family HTx25

### Order Code – Full Overview

>>Please refer to the series sections for details and valid selection criteria

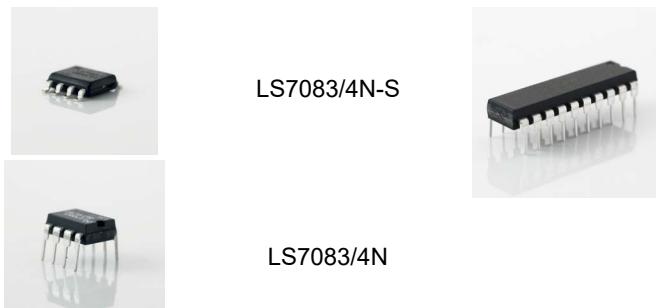

## Shaft couplings

- Connect two shafts, even with different diameters
- Absorb larger angular and radial deviations
- Have a low inertia
- Do not cause a change in the transmission speed
- Damp torsional vibrations
- Serves as mechanical protection against oversized pairs of forces
- Made of plastic (also with metal hubs) act electrically and heat insulating

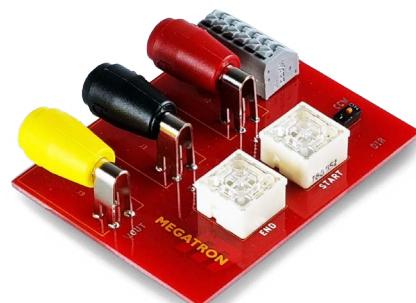

## Counter ICs for incremental encoders

- LS7083 in DIP or SOIC form factor, generates from incremental-signals quadrature-signals
- LS7166 24-Bit counter IC

## Programmer for programmable encoder HTA25PM

- For programming of the sense of rotation (CCW/CW)
- For programming of the effective electrical angle of rotation [°]
