## Family HTx36

### Key Features

- Ø36 aluminium metal housing
- Maximum life time expectation
- High continuous actuation shaft speeds
- High shaft loads
- Magnetic, gradient-based signal evaluation
- Digital signal processing
- Double ball bearings
- Protection: Shaft bearings IP65, option IP67, Housing IP68
- Operating temperature -30 to 85°C
- Measuring range 360° singleturn, up to 72000° multiturn
- Electrical connections M12 plug or round signal cable
- Cable/connector outlet radial or axial
- Programmable signal output function (factory or field-programmable/teach-in)

### Applications

- Plant engineering
- Mechanical engineering
- Equipment manufacturing
- Driverless transport systems
- Medical equipment
- Special vehicles
- Industrial robots
- Wind turbines
- Motor control units
- Stage technology

**HTx36 encoder – robust, ball bearing, sealed, with solid or hollow shaft**

The HTx36 range of encoders is designed for use between simple and heavy duty applications. With a wide range of electronic and mechanical options, these contactless encoders in a Ø36 mm metal housing can be adapted to suit any application. Whether as incremental or absolute encoders, they cover a wide range of applications and, depending on the output electronics, are used in systems, laboratory equipment and medical devices, for example.

The HTx36 encoders are among the most robust encoders in the MEGATRON range. This is due to the solid aluminium housing, the high IP protection class and the double ball bearing stainless steel shaft, which withstands high axle loads and allows high actuation speeds. Signal processing is digital and based on magnetic recording of the measured values. The gradient based evaluation ensures high immunity to temperature variations and EMC influences. This technology overcomes the disadvantages of conventional Hall sensors. HTx36 encoders are designed for maximum durability, even surpassing the robust optical data acquisition. The number of defects or failures in encoders with this technology design is virtually zero, even after decades of use.

In addition to a wide range of standard options, the modular design of the HTx36 encoders enables optimum adaptation to the specific requirements of the application. In addition, the concept allows for timely customisation (even in small batches) based on a clearly structured pricing model. Typical modifications include customised shaft geometries, signal output functions, special cable lengths or customised electrical connection cables.

### Series HTA36 – singleturn, analogue output, not redundant

#### Key features HTA36

- Analogue outputs 0 to 5 V, 0 to 10 V, 4 to 20 mA
- Redundant versions available – see separate section
- Several factory programming possibilities
- Supply voltages: 5 VDC  $\pm 10\%$ , 15 to 30 VDC, 9 to 30 VDC

#### Electrical data

|  |  |            |            |
|--|--|------------|------------|
| Effective electrical angle of rotation 1.)     | 7° $\leq \alpha \leq 360^\circ$ (programmable in factory), $\pm 0.5^\circ$ |            |            |
| Independent linearity (best straight line) 1.) | $\pm 0.3\% @ 360^\circ$  |            |            |
| Absolute Linearity 1.)                         | $\pm 0.6\% @ 360^\circ$  |            |            |
| Output signal                                  | 0 to 5 V ratiometric   | 0 to 10 V  | 4 to 20 mA |
| Resolution                                     | 12 Bit   |            |            |
| Update rate                                    | 200 $\mu$ s  |            |            |
| Supply voltage                                 | 5 V $\pm 10\%$   | 15 to 30 V | 9 to 30 V  |
| Power consumption (no load)                    | $\leq 18$ mA   |            |            |
| Output load                                    | $\geq 5$ kOhm  |            |            |
| Insulation voltage 1.)                         | 1000 VAC @ 50 Hz, 1 min  |            |            |
| Insulation resistance 1.)                      | 2 MOhm @ 500 VDC, 1 min  |            |            |
| MTTF (SN29500-2005-1)                          | 1173a  | 965a       | 379a       |

1.) According IEC 60393

#### Cable and pin assignment

| Function: | Option PG(R) | Option M12(R) |
|-----------|--------------|---------------|
| VSUP      | red          | PIN 1         |
| GND       | black        | PIN 2         |
| OUT       | brown        | PIN 3         |
| -         | -            | PIN 4 n/c     |

#### Plug M12 (R) HTA36 – pin assignment

##### Type 1 (4 pole)

The orientation of the connector relative to the encoder housing is not defined and differs from one encoder to the next. When using angled connectors in combination with axial outlet, the orientation of the cable outlet is thus not defined.

If you need a defined orientation of the cable outlet, please choose our housings with radial cable outlet and use straight mating connectors.

## Absolute Encoders with Current Loop or Voltage Output

## Series HTA36

**Order example HTA36 H – hollow shaft, singleturn, analogue output, not redundant**

## Requirements:

Hollow shaft Ø 6.00 mm, fixation of the application side shaft in the hollow shaft by means of grub screw,  $V_{\text{SUP}} = 24 \text{ V} / \text{OUT} = 4 \text{ to } 20 \text{ mA}$ , sense of rotation CW, electrical angle 360°, no shaft sealing, round cable 1 m, cable outlet position axial (in dependency to the shaft)

**Example for order code:** HTA36 H 6 2442 CW360 PG

### Series HTA36X – singleturn, redundant

#### Key features HTA36X :

- Independent signal processing. The HTA36X rotary encoder electronics are based mainly on one 3D-Hall IC in which two semiconductor chips independently capture, evaluate and output the measured values
- Supply voltage, signal output and ground are galvanically insulated => separate electrical connections
- Supply voltages: 2 x 5 VDC or 2 x 15 to 30 VDC
- Signal outputs: 2 x 0 to 5 V or 2 x 0 to 10 V

### Electrical data HTA36X – singleturn, redundant

|  |   |            |
|--|---|------------|
| Effective electrical angle of rotation 1.)     | $7^\circ \leq \alpha \leq 360^\circ$ (programmable at factory), $\pm 0.5^\circ$ |            |
| Independent linearity (best straight line) 1.) | $\pm 0.3\%$ @ $360^\circ$   |            |
| Absolute Linearity 1.)                         | $\pm 0.6\%$ @ $360^\circ$   |            |
| Output signal                                  | 0 to 5 V ratiometric  | 0 to 10 V  |
| Resolution                                     | 12 Bit  |            |
| Update rate                                    | 200 $\mu$ s   |            |
| Supply voltage                                 | 5 V $\pm 10\%$  | 15 to 30 V |
| Power consumption (no load)                    | $\leq 23$ mA  |            |
| Output load                                    | $\geq 5$ kOhm   |            |
| Insulation voltage 1.)                         | 1000 VAC @ 50 Hz, 1 min   |            |
| Insulation resistance 1.)                      | 2 MOhm @ 500 VDC, 1 min   |            |
| MTTF (SN29500-2005-1)                          | 613a  | 202a       |

1.) According IEC 60393

### Cable and pin assignment HTA36X – singleturn, analogue output, redundant

| Function: | Option PG(R) | Option M12(R) |
|-----------|--------------|---------------|
| VSUP 1    | red          | PIN 1         |
| OUT 1     | brown        | PIN 2         |
| GND 1     | black        | PIN 3         |
| GND 2     | green        | PIN 4         |
| OUT 2     | yellow       | PIN 5         |
| VSUP 2    | orange       | PIN 6         |
| -         | -            | PIN 7 n/c     |
| -         | -            | PIN 8 n/c     |

### Plug M12 (R) HTA36X – pin assignment

#### Type 2 (8 pole)

The orientation of the connector relative to the encoder housing is not defined and differs from one encoder to the next. When using angled connectors in combination with axial outlet, the orientation of the cable outlet is thus not defined.

If you need a defined orientation of the cable outlet, please choose our housings with radial cable outlet and use straight mating connectors.

**Order example HTA36X S - solid shaft, singleturn, analogue output, not redundant**

## Requirements:

Solid shaft Ø 6.00 mm, shaft length 16.5 mm, VSUP=24 V / OUT=0 to 10 V, signal 1 sense of rotation CW, signal 2 sense of rotation CW, electrical angle 360°, no shaft sealing, round cable 1 m, cable outlet position axial (in dependency to the shaft)

### Example for order code:

Example for order code:

### Series HTP36 – singleturn, not redundant

#### Key features HTP36:

- PWM signal output
- Frequency 244 Hz (constant)
- Pulse width (duty cycle) 10% (0°) to 90% (360°)
- Supply voltage: 5 VDC +/-10%

### Electrical data HTP36 – singleturn, not redundant

Effective electrical angle of rotation 1.)  $7^\circ \leq \alpha \leq 360^\circ$  (programmable in factory),  $\pm 0.5^\circ$

Independent linearity (best straight line) 1.)  $\pm 0.4\%$  @ 360°

Absolute Linearity 1.)  $\pm 0.6\%$  @ 360°

Output signal PWM (pulse width modulation)

Output signal voltage 5 V

Carrier frequency 244 Hz (constant)

Minimum duty cycle 10%, equal to app. 0.4 ms

Maximum duty cycle 90%, equal to app. 3.5 ms

Resolution 12 Bit

Supply voltage 5 V  $\pm 10\%$

Power consumption (no load)  $\leq 10$  mA

Output load  $\geq 5$  kOhm

Insulation voltage 1.) 1000 VAC @ 50 Hz, 1 min

Insulation resistance 1.) 2 MOhm @ 500 VDC, 1 min

MTTF (SN29500-2005-1) 1267a

1.) According IEC 60393

### Function description HTP36

The HTP36 provides a constant carrier frequency with 244 Hz at the signal output, with HIGH and LOW signal levels which have a constant signal amplitude. A constant carrier frequency means a constant length of the period duration. The duty cycle and thus the pulse width changes in dependency of the rotating angle between 10% to 90% relative to the signal period.

If the CW option is selected, the duty cycle increases clockwise when turning the shaft clockwise. If the CCW option is selected, the duty cycle decreases clockwise if the shaft is turned clockwise. Normally no signal conversion is required for further processing of the output signal, because many µControllers already have an input for PWM signals.

### Cable and pin assignment HTP36 – singleturn, analogue output, not redundant

| Function: | Option PG(R) | Option M12(R) |
|-----------|--------------|---------------|
| VSUP      | red          | PIN 1         |
| GND       | black        | PIN 2         |
| OUT       | brown        | PIN 3         |
| -         | -            | PIN 4 n/c     |

### Plug M12 (R) HTP36 – pin assignment

#### Type 1 (4 pole)

The orientation of the connector relative to the encoder housing is not defined and differs from one encoder to the next. When using angled connectors in combination with axial outlet, the orientation of the cable outlet is thus not defined.

If you need a defined orientation of the cable outlet, please choose our housings with radial cable outlet and use straight mating connectors.

## Absolute Encoders with Pulse Width Modulation (PWM)

### Order example HTS36 – solid shaft, singleturn, serial output, not redundant

#### Requirements:

Solid shaft Ø 6.00 mm, shaft length 16.5 mm, electronics: 12 Bit/SSI, no shaft sealing, round cable 1 m, cable outlet position axial

#### Example for order code:

HTS36 S 6x16,5 SSI 12 PG

**Order example HTS36 – hollow shaft, singleturn, serial output, not redundant**
**Requirements:**

Hollow shaft Ø 6,00 mm, fixation of the applications side shaft in the hollow shaft by means of grub screws, electronics 12Bit/24VDC/SSI, no shaft sealing, round cable 1 m, cable outlet position axial

**Example for order code:**

HTS36 H 6 SSI 12 PG

**Cable and pin assignment HTS36 - singleturn, SSI interface, not redundant**

| Function: | Option PG(R) | Option M12(R) |
|-----------|--------------|---------------|
| GND       | black        | PIN 1         |
| VSUP      | red          | PIN 2         |
| CLK+      | brown        | PIN 3         |
| CLK-      | orange       | PIN 4         |

| -         | -            | PIN 7 n/c     |
| -         | -            | PIN 8 n/c     |

### Synchronous Serial Interface (SSI) - A simple yet robust interface

The synchronous serial interface (SSI) is a serial interface, i.e. the individual bits are transmitted in chronological order. The basis of data transmission is a shift register in which the encoder provides its current measured value. The rotary encoders function as so-called SSI slaves, because they only supply the values from the shift register at the DO (data out) output on receipt of a clock sequence sent out by the SSI master, the so-called "clock" signal (CLK). This clock signal is applied to the CLK input of the encoder. Both the clock signal and the data signal are transmitted differentially, which makes this type of data interface particularly robust against interference. In short, SSI enables the memory of a sensor to be read out reliably from an external source.

#### Data transmission

The SSI electronics of the encoder reacts to the first falling edge that arrives via the CLK line of the master, loads the current data into the register and transmits it bit by bit to the receiver with each rising edge of the clock. The composition of the transmitted information is not standardised and varies from manufacturer to manufacturer, sometimes even from product to product.

In MEGATRON's encoders, the position information is transmitted first (starting with the Most Significant Bit MSB, ending with the Least Significant Bit LSB). The maximum value of this information is limited by the number of bits transmitted. This is also the resolution of the measurement data. For example, a resolution of 10 bits corresponds to a number of  $2^{10} = 1024$  steps, which are divided over the angular range of  $360^\circ$ . Thus, after receiving the position information, it is easy to calculate back to the absolute angle, because each single step would correspond to  $360/1024 = 0.35^\circ$ .

The position information is followed by a bit sequence of status data that can be of great interest for the application. This includes, for example, the status of the electronics (readiness, correct supply voltage), but also whether the magnetic field acting on the Hall sensor is within the permissible limits (i.e. the distance of the magnet from the sensor). The last bit is the parity bit. This takes the values HIGH or LOW as required, so that the encoder always sends an even number of bits (even parity). The receiver, i.e. the SSI master, must be set to the total length of the transmitted information including the parity bit.

At the end of the process, the master usually does not send any further edges to the encoder via the CLK line. The encoder then waits for a time  $t_m$ , (retriggerable monoflop) since the last CLK edge and then updates the data in the shift register. This is therefore the minimum pause time between two consecutive clock sequences when the master requires new, updated measurement data. The exact protocol description of the HTS encoders follows on the next page

#### Ring shift

However, if clock edges continue to be sent, then the encoder will start transmitting the same data set repeatedly after a zero bit. This procedure is also called ringshift. This makes sense, for example, if the parity bit would be incorrect from the master's point of view, if the data is otherwise corrupt and a new transmission is therefore requested, or if a higher transmission reliability is generally desired by comparing multiple transmissions of the same data. With ring shift, the transmission is also terminated and the latest measurement data is only loaded into the register again when no more clock signals arrive at the encoder for a minimum time  $t_m$ .

#### Early stop

The transmission of the data can be interrupted by the master at any time, e.g. also after the 10th bit. Even then, the internal timer (monoflop) expires, causing the data in the register to be reloaded after the time  $t_m$ . In this way, for example, only a part of the encoder data can be read out (e.g. 10 of the available 16 bits, no status data at all) and a higher update rate can be achieved, as the remaining information is simply omitted.

#### Notes on cable length

The higher the transmission rate (clock rate), the smaller the realisable cable length with SSI. These are physical limits that are not limited by the sensor product itself. A simple blanket statement about the actual realisable length is not easily possible.

The cable length that can actually be realised in the application is influenced by the following factors:

- Quality and design of the cable (shielding, conductor cross-section, conductor resistance, twisted cores, etc.).
- Ambient conditions (sources of interference such as motors, etc.)

We explicitly refer to the RS-422 standard regarding cable lengths.

### Protocol description – Synchronous Serial Interface (SSI)

The HTS25K SSI encoder provides a 10-bit to 18-bit absolute position output, while 16 bit is the standard (ex works) configuration. This means that the full rotation angle ( $360^\circ$ ) is divided into steps of the respective resolution (16 bits yields 65.536 steps of approx. 0.005 degrees).

Standard configuration (16 bit output) yields the following pulse train, consisting both of position and status data:

|                       |    |    |    |    |    |    |    |    |    |    |    |                    |    |   |   |   |   |   |   |   |   |   |   |
|-----------------------|----|----|----|----|----|----|----|----|----|----|----|--------------------|----|---|---|---|---|---|---|---|---|---|---|
| 23                    | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11                 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| 16 bits position data |    |    |    |    |    |    |    |    |    |    |    | 7 bits status data |    |   |   |   |   |   |   |   |   |   |   |

The data structure for any resolution is as follows:

| Position data (10 to 18 bits) |       |     |     | Status (7-bit) |     |     |    |    |     |     | Parity 1 bit |
|-------------------------------|-------|-----|-----|----------------|-----|-----|----|----|-----|-----|--------------|
| MSB                           | MSB-1 | ... | LSB | RDY            | MHI | MLO | OV | UV | MEM | TRK | PAR          |

| Abbreviation | Description   |
|--------------|---|
| MSB to LSB   | n-bits position data, selectable from 10 to 18 bits ex works, standard is 16 bit  |
| RDY          | The encoder is ready (if value is HIGH).  |
| MHI          | This indicates that the magnet strength detected by the Hall chip is too strong. If this is consistently HIGH, change to a weaker magnet or increase the distance between the encoder and the magnet. The value for this alarm is displayed as 1. |
| MLO          | This indicates that the magnet strength detected by the Hall chip is too weak. If this is consistently HIGH, change to a stronger magnet or decrease the distance between the encoder and the magnet. The value for this alarm is displayed as 1. |
| OV           | Overvoltage error at Hall Chip if HIGH. Might indicate defective voltage regulator (encoder's internal regulator).  |
| UV           | Undervoltage error if HIGH. Might indicate too low input voltage or defective voltage regulator (encoder's internal regulator).   |
| MEM          | If HIGH, a memory corruption has occurred. Perform a power cycle to reload the memory.  |
| TRK          | This indicates that the angular error has exceeded $5^\circ$ within 5 ms. When this value stays at HIGH, perform a power-cycle to re-initialize the sensor.   |
| PAR          | Parity is even  |

Data is transmitted according to the following timing diagram:

| Symbol    | Description                                     | Min.         | Typ.       | Max.      |
|-----------|---|--------------|------------|-----------|
| $t_{CLK}$ | Serial clock period                             | 4 $\mu$ s    |            | $t_{M/2}$ |
| $t_M$     | monoflop, time between two successive SSI reads | 16.5 $\mu$ s | 18 $\mu$ s |           |

Data is latched on the first CLK falling edge and is transmitted on the next falling edge. Both signals are transmitted differentially and therefore have 2 connections (+/-) each. Data will be refreshed when the next monoflop ( $t_M$ ) expires. If another clock train is sent before this time expires, the same position data is output, and the data is separated by a single low bit:

**Protocol description – Serial Peripheral Interface (SPI)**
**Introduction**

The encoder is configured as a Slave node. The serial protocol of the is a three wires protocol (/SS, SCLK, MOSI-MISO):

- /SS output is a 5 V tolerant digital input
- SCLK output is a 5 V tolerant digital input
- MOSI-MISO output is a 5 V tolerant open drain digital input/output

Basic knowledge of the standard SPI specification is required for the good understanding of the present section.

Even clock changes are used to sample the data. The positive going edge shifts a bit to the Slave's output stage and the negative going edge samples the bit at the Master's input stage.

**MOSI (Master Out Slave In)**

The Master sends a command to the Slave to get the angle information.

**MISO (Master In Slave Out)**

The MISO of the slave is an open-collector stage. Due to the capacitive load, a  $>1\text{ k}\Omega$  pull-up is used for the recessive high level (in fast mode). Note that MOSI and MISO use the same physical wire of the ETS25.

**/SS (Slave Select)**

The /SS output enables a frame transfer. It allows a re-synchronization between Slave and Master in case of a communication error.

**Master Start-Up**

/SS, SCLK, MISO can be undefined during the Master start-up as long as the Slave is re-synchronized before the first frame transfer.

**Slave Start-Up**

The slave start-up (after power-up or an internal failure) takes 16 ms. Within this time /SS and SCLK is ignored by the Slave. The first frame can therefore be sent after 16 ms. MISO is Hi-Z (i.e. Hi-Impedance) until the Slave is selected by its /SS input. The encoder will cope with any signal from the Master while starting up.

**Timing**

To synchronize communication, the Master deactivates /SS high for at least  $t_5$  (1.5 ms). In this case, the Slave will be ready to receive a new frame. The Master can re-synchronize at any time, even in the middle of a byte transfer. Note: Any time shorter than  $t_5$  leads to an undefined frame state, because the Slave may or may not have seen /SS inactive.

**Protocol description – Serial Peripheral Interface (SPI) (continuation)**
**Description Timings**

| Timings              | Min          | Max         | Remarks  |
|----------------------|--------------|-------------|--|
| t1                   | 2.3 $\mu$ s  | -           | No capacitive load on MISO. t1 is the minimum clock period for any bits within a byte.         |
| t2                   | 12.5 $\mu$ s | -           | t2 the minimum time between any other byte   |
| t4                   | 2.3 $\mu$ s  | -           | Time between last clock and /SS=high=chip de-selection   |
| t5                   | 300 $\mu$ s  | -           | Minimum /SS = Hi time where it's guaranteed that a frame re-synchronizations will be started   |
| t5                   | 0 $\mu$ s    | -           | Maximum /SS = Hi time where it's guaranteed that NO frame re-synchronizations will be started. |
| t6                   | 2.3 $\mu$ s  | -           | The time t6 defines the minimum time between /SS = Lo and the first clock edge                 |
| t7                   | 15 $\mu$ s   | -           | t7 is the minimum time between the StartByte and the Byte0                                     |
| t9                   | -            | < 1 $\mu$ s | Maximum time between /SS = Hi and MISO Bus High Impedance                                      |
| T <sub>Startup</sub> | -            | < 10 ms     | Minimum time between reset-inactive and any master signal change                               |

**Slave Reset**

On internal soft failures the Slave resets after 1 second or after an (error) frame is sent. On internal hard failures the Slave resets itself. In that case, the Serial Protocol will not come up. The serial protocol link is enabled only after the completion of the first synchronization (the Master deactivates /SS for at least t5).

**Frame Layer**
**Command Device Mechanism**

Before each transmission of a data frame, the Master should send a byte AAh to enable a frame transfer. The latch point for the angle measurement is at the last clock before the first data frame byte.

**Data Frame Structure**

A data frame consists of 10 bytes:

- 2 start bytes (AAh followed by FFh)
- 2 data bytes (DATA16 – most significant byte first)
- 2 inverted data bytes (/DATA16 - most significant byte first)
- 4 all-Hi bytes

The Master should send AAh (55h in case of inverting transistor) followed by 9 bytes FFh. The Slave will answer with two bytes FFh followed by 4 data bytes and 4 bytes FFh.

## Protocol description – Serial Peripheral Interface (SPI) (Fortsetzung)

### Timing

There are no timing limits for frames: a frame transmission could be initiated at any time. There is no interframe time defined.

### Data Structure

The DATA16 could be a valid angle or an error condition. The two meanings are distinguished by the LSB.

#### DATA16: Angle A[13:0] with (Angle Span)/2<sup>14</sup>

| Most Significant Byte |     |     |     |    |    |    |     |     |    |    |    |    |    | Least Significant Byte |   |
|-----------------------|-----|-----|-----|----|----|----|-----|-----|----|----|----|----|----|------------------------|---|
| MSB                   |     |     |     |    |    |    | LSB | MSB |    |    |    |    |    | LSB                    |   |
| A13                   | A12 | A11 | A10 | A9 | A8 | A7 | A6  | A5  | A4 | A3 | A2 | A1 | A0 | 0                      | 1 |

#### DATA16: Error

| Most Significant Byte |     |     |     |     |     |    |     |     |    |    |    |    |    | Least Significant Byte |    |
|-----------------------|-----|-----|-----|-----|-----|----|-----|-----|----|----|----|----|----|------------------------|----|
| MSB                   |     |     |     |     |     |    | LSB | MSB |    |    |    |    |    | LSB                    |    |
| E15                   | E14 | E13 | E12 | E11 | E10 | E9 | E8  | E7  | E6 | E5 | E4 | E3 | E2 | E1                     | E0 |

#### DATA16: Error

| BIT | Name         | Description   |
|-----|--------------|---|
| E0  | 0            |   |
| E1  | 1            |   |
| E2  | F_ADCMONITOR | ADC Failure   |
| E3  | F_ADCSATURA  | ADC Saturation (Electrical failure or field too strong)               |
| E4  | F_RGTOOLOW   | Analog Gain Below Trimmed Threshold (Likely reason: field too weak)   |
| E5  | F_MAGTOOLOW  | Magnetic Field Too Weak   |
| E6  | F_MAGTOOHIGH | Magnetic Field Too Strong   |
| E7  | F_RGTOOHIGH  | Analog Gain Above Trimmed Threshold (Likely reason: field too strong) |
| E8  | F_FGCLAMP    | Never occurring in serial protocol                                    |
| E9  | F_ROCLAMP    | Analog Chain Rough Offset Compensation: Clipping                      |
| E10 | F_MT7V       | Device Supply VDD Greater than 7V                                     |
| E11 | -            |   |
| E12 | -            |   |
| E13 | -            |   |
| E14 | F_DACMONITOR | Never occurring in serial protocol                                    |
| E15 | -            |   |

### Angle Calculation

All communication timing is independent (asynchronous) of the angle data processing. The angle is calculated continuously by the Slave every 350 µs at most. The last angle calculated is hold to be read by the Master at any time. Only valid angles are transferred by the Slave, because any internal failure of the Slave will lead to a soft reset.

### Error Handling

In case of any errors listed above, the Serial protocol will be initialized and the error condition can be read by the master. The slave will perform a soft reset once the error frame is sent. In case of any other errors (ROM CRC error, EEPROM CRC error, RAM check error, intelligent watchdog error...) the Slave's serial protocol is not initialized. The MOSI/MISO output will stay Hi-impedant (no error frames are sent).

### Series HTI36 - singleturn, incremental output

#### Key features HTI36:

- Channels: A, B and index signal Z
- TTL or Open Collector electronics
- Maximum number of pulses per channel 1.024 (TTL), 20.000 pulses per revolution (option BZOC only)
- Option: ex works programmable number of pulses in pulse step width 1

### Electrical data HTI25K – singleturn, incremental output

|                             |                         |                              |
|-----------------------------|-------------------------|------------------------------|
| Output Signal               | TTL                     | Open Collector               |

### Output circuit HTI36 per channel

### Connector types M12 (R) HTI36 – pin numbering

#### Type 2 (8 pole)

#### Type 3 (12 pole, special versions only)

The orientation of the connector relative to the encoder housing is not defined and differs from one encoder to the next. When using angled connectors in combination with axial outlet, the orientation of the cable outlet is thus not defined.

If you need a defined orientation of the cable outlet, please choose our housings with radial cable outlet and use straight mating connectors.

## Incremental Encoders

## Series HTI36

Order example HTI36 - solid shaft, singleturn, incremental output

## Requirements:

Solid shaft Ø 6.00 mm, Shaft length 16.5 mm, number of pulses 1024, VSUP=5 V/TTL output signal, no shaft sealing, round cable 1 m, cable outlet position axial (in dependency to the shaft)

### Example for order code:

Example for order code:

Cable and pin assignment HTI36 – option PP, TTL, OC

| Function: | Option PG(R) | Option M12(R) |
|-----------|--------------|---------------|
| GND       | black        | PIN 1         |
| VSUP      | red          | PIN 2         |
| Z         | yellow       | PIN 3         |
| B         | orange       | PIN 4         |

**Series HTA36PM – multiturn/singleturn, programmable, analogue output, not redundant**

## Key features HTA36PM :

- Measuring range 10° to max. 72000° (200 shaft revolutions)
- Programmable by the user. Programmable are the sense of rotation (CW/CCW) and the effective electrical angle [°]
- Programmable up to 10.000 times
- Can also be used as a programmable singleturn rotary encoder
- Maximum rotation of the shaft in a voltage-free state without loss of the angle information +/-179°
- Factory programming (ex works): effective electrical angle of rotation 3600° (10 shaft revolutions), sense rotation CW
- Supply voltage: 9 to 30 VDC, 15 to 30 VDC
- Output signal: 4 to 20 mA, 0 to 5 V, 0 to 10 V

## Electrical data HTA36PM – multiturn/singleturn, programmable, analogue output, not redundant

1.) According IEC 60393

## Signal output function (factory programming). Automatic function for inserting signal plateaus

The function represents the relationship between the zero degree marking on the rotary encoder housing in dependency to the  $0^\circ$  position of the shaft and the resulting output signal in the state of delivery, when turning the shaft clockwise (sense of rotation CW). The effective electrical angle of rotation is  $3600^\circ$  ex works. Before and after the linearly rising output signal for  $3600^\circ$  the HTA36PM integrates automatically signal plateaus for a rotation angle of each  $180^\circ$ .

The following example shows the output signal pattern when actuating the shaft in the delivery state for 11 revolutions clockwise (sense of rotation CW), starting at the  $0^\circ$  position:

clockwise (sense of rotation CW), starting at the 0° position:

1. 10 rotations of the shaft clockwise 0° to 3600°, linearly increasing output signal 0% to 100% FS
2. 1/2 rotation of the shaft 180° (3600° to 3780°) signal plateau 100% FS
3. 1/2 rotation of the shaft 180° (3780° to 3960°) signal plateau 0% FS

The drawing shows the signal-amplitude function for 0 to 10 V signal output

## Programmable Multi-/Singletturn Encoders

HTA36PM

### Order code HTA36PM – multiturn/singletturn, programmable, analogue output, not redundant

#### Description:

User-programmable multiturn/singletturn rotary encoder. Programmable sense of rotation, effective electrical angle ex works: CW, 3600° (10 turns)

Selection: standard=black/bold, possible options=grey/italic

#### Series HTA36PM

HTA36

**S**  
**H**  
HK

#### Shaft type:

**Solid shaft**

**Hollow shaft with screw fixation**

Option: *with clamp fixation*

#### Shaft diameter, shaft length:

**Shaft diameter Ø 6 mm**

*Shaft diameter Ø 8 mm*

*Shaft diameter Ø 6.35 mm*

*User-defined shaft diameter [mm]*

*Ø ≤ 8 mm in connection with option S*

*Ø ≤ 10 mm in connection with option H or HK*

*Ø ≤ 12 mm exclusively in connection with option H*

**6**  
8  
6,35  
X

#### Multiplication symbol [x]:

#### Visible shaft length:

**Shaft length 16.5 mm for solid shaft (S)**

**16,5**

**Shaft length for hollow shafts H or HK**

-

*User-defined shaft length for solid shaft S [mm]*

XX

#### Supply voltage / Output signal:

VSUP=24 V (11 to 30 V) / OUT=4 to 20 mA

**2442**

VSUP=24 V (9 to 30 V) / OUT=0 to 5 V

**2405**

VSUP=24 V (15 to 30 V) / OUT=0 to 10 V

**2410**

#### Shaft sealing:

**Without shaft sealing IP65**

*With shaft sealing (IP67)*

**D**

#### Electrical connection, cable length, position:

**1 m round cable, axial**

**PG**

**1 m round cable, radial**

**PGR**

**Plug M12, axial**

**M12**

**Connector M12, radial**

**M12R**

*Round cable, customer-specific cable length [X,XX m], axial*

**PG X,XX**

*Round cable, customer-specific cable length [X,XX m], radial*

**PGR X,XX**

### Order example HTA36PM S – solid shaft, multiturn/singletturn, programmable, analogue output, not redundant

#### Requirements:

Shaft Ø 6.00 mm, shaft length 16.5 mm, VSUP=24 V / OUT=0 to 5 V, sense of rotation ex works CW (programmable by customer), effective electrical angle ex works 3600° (programmable by the customer), no shaft sealing, round cable 1 m, cable outlet position axial (in dependency to the shaft)

**Example for order code:** HTA36PM S 6x16,5 2405 PG

### Order example HTA36PM H – hollow shaft, multiturn/singletturn, programmable, analogue output, not redundant

#### Requirements:

Hollow shaft Ø 6.00 mm, fixation of the applications side shaft in the hollow shaft by means of grub screws, VSUP=24 V / OUT=4 to 20 mA, sense of rotation ex works CW (programmable by customer), effective electrical angle ex works 3600° (programmable by the customer), no shaft sealing, round cable 1 m, cable outlet position axial (in dependency to the shaft)

**Example for order code:** HTA36PM H 6 2442 PG

## Order example HTA36PM programmer

## Key features HTA36PM programmer "PRO":

- For programming of the sense of rotation (CCW/CW)
- For programming of the effective electrical angle of rotation [°]

| EN 61000-4-3 RF sine wave                                | Class A |
| EN 61000-4-6 Conducted sine wave                         | Class A |
| EN 61000-4-8 Power frequency magnetic fields             | Class A |
| EN 61000-4-2 ESD   | Class B |
| REACH Regulation (EC) 1907/2006 including the SVHC list  |         |
| RoHS Directive 2011/65/EU                                |         |

### Order Code – Full Overview

>>Please refer to the series sections for details and valid selection criteria

### Servomount fixing nails SFN for encoders with solid shaft

- Required for mounting the rotary encoder when using synchro flange
- Fastening the rotary encoder requires at least 3 pcs.
- Ideal for panel mounting of the rotary encoder so that no holes have to be drilled through the panel
- By rotating the rotary encoder housing around its own axis, synchro clamps allow a zero point alignment with an application-side shaft that is already coupled to the rotary encoder (0° position)
- Material: stainless steel

### M12 plugs without or with cable for option M12(R)

- STE plug without cable
- STK plug with cable

### Shaft couplings for encoders with solid shaft

- Connect two shafts, even with different diameters
- Absorb larger angular and radial deviations
- Have a low inertia
- Do not cause a change in the transmission speed
- Damp torsional vibrations
- Serves as mechanical protection against oversized pairs of forces
- Made of plastic (also with metal hubs) act electrically and heat insulating

### Counter ICs for HTI36 (incremental encoders)

- LS7083 in DIP or SOIC form factor, generates from incremental-signals quadrature-signals
- LS7166 24-Bit counter IC

### Programmer "PRO" for multturn encoder HTA36PM

- For programming of the sense of rotation (CCW/CW)
- For programming of the effective electrical angle of rotation [°]
